# INTRODUCTION

The Library Management System is a software application designed to streamline the organization and accessibility of a library's book collection. It facilitates efficient cataloging, user interaction, and book lending processes.

## PROCESS

1. Define Book Class:
  - Create a class named Book with attributes for title, author, and ID.
2. Define Library Class:
  - Create a class named Library that contains a vector of Book objects.
3. Implement methods within the Library class:
  - addBook: Adds a new book to the library.
  - displayBooks: Displays information about all books in the library.
  - removeBook: Removes a book from the library based on its ID.
  - Implement Main Function:
4. Create the main function.
  - Declare a Library object to manage the library.
  - Enter a continuous loop for the main menu.
5. User Interaction Loop:
  - Display the main menu with options:
  - Add Book
  - Display Books
  - Remove Book
  - Exit
6. Handle User Input:
  - Accept user input for menu choice.
7. Process User Choice:
  - a) If the user chooses to add a book:
    - Prompt for book details (title, author, and ID).
    - Create a new Book object and add it to the library using the addBook method.
  - b) If the user chooses to display books:
    - Call the displayBooks method to show information about all books in the library.
  - c) If the user chooses to remove a book:
    - Prompt for the book ID to be removed.
    - Call the removeBook method to remove the specified book.

d) If the user chooses to exit:

- Terminate the program.

8. Compile and Run:

- Compile the code using a C++ compiler.
- Run the compiled program.
- Interact with the Program.

## CODE

```
#include <iostream>
#include <vector>
#include <string>
#include <algorithm>

using namespace std;

class Book {
public:
    string title;
    string author;
    int id;

    Book(string t, string a, int i) : title(t), author(a), id(i) {}
};

class Library {
private:
    vector<Book> books;

public:
    void addBook(const Book& book) {
        books.push_back(book);
        cout << "Book added successfully.\n";
    }

    void displayBooks() {
        cout << "Library Books:\n";
        for (const auto& book : books) {
            cout << "ID: " << book.id << ", Title: " << book.title << ", Author: " <<
book.author << endl;
        }
    }

    void removeBook(int bookId) {
        auto it = find_if(books.begin(), books.end(), [bookId](const Book& b) {
```

```

return b.id == bookId;
});

if (it != books.end()) {
    books.erase(it);
    cout << "Book removed successfully.\n";
} else {
    cout << "Book not found.\n";
}
}
};

```

```

int main() {
    Library library;

    while (true) {
        cout << "\nLibrary Management System\n";
        cout << "1. Add Book\n";
        cout << "2. Display Books\n";
        cout << "3. Remove Book\n";
        cout << "4. Exit\n";
        cout << "Enter your choice: ";

        int choice;
        cin >> choice;

        switch (choice) {
            case 1: {
                string title, author;
                int id;

                cout << "Enter book title: ";
                cin.ignore();
                getline(cin, title);

                cout << "Enter book author: ";
                getline(cin, author);

                cout << "Enter book ID: ";
                cin >> id;

                Book newBook(title, author, id);
                library.addBook(newBook);
                break;
            }
            case 2:
                library.displayBooks();
                break;

```

```

case 3: {
    int id;
    cout << "Enter book ID to remove: ";

    cin >> id;
    library.removeBook(id);
    break;
}
case 4:
    cout << "Exiting the program.\n";
    return 0;
default:
    cout << "Invalid choice. Try again.\n";
}
}

return 0;
}

```

## RESULTS

The screenshot displays the Programiz C++ Online Compiler interface. The code editor on the left contains the C++ code for a Library Management System. The output window on the right shows the program's execution, including the menu, user input for adding books, and the confirmation messages.

```

main.cpp
1 #include <iostream>
2 #include <vector>
3 #include <string>
4 #include <algorithm>
5
6 using namespace std;
7
8 class Book {
9 public:
10     string title;
11     string author;
12     int id;
13
14     Book(string t, string a, int i) : title(t), author(a), id(i) {}
15 };
16
17 class Library {
18 private:
19     vector<Book> books;
20
21 public:
22     void addBook(const Book& book) {
23         books.push_back(book);
24         cout << "Book added successfully.\n";
25     }
26

```

Output:

```

/tmp/dg0JuK7hPh.o
Library Management System
1. Add Book
2. Display Books
3. Remove Book
4. Exit
Enter your choice: 1
Enter book title: OOPS USING C++
Enter book author: VARUN
Enter book ID: 961
Book added successfully.

Library Management System
1. Add Book
2. Display Books
3. Remove Book
4. Exit
Enter your choice: 1
Enter book title: DSA
Enter book author: GOPAL
Enter book ID: 945
Book added successfully.

Library Management System
1. Add Book
2. Display Books

```
